PWS AWARENESS MONTH FACT #1

PWS affects one in 15 – 20,000 births
PWS AWARENESS MONTH FACT #2

Prader-Willi syndrome affects all races and genders equally
Doctors Prader, Willi, and Labhart discovered PWS in 1956 based on the clinical features of nine children. Since 1956, diagnosis has been confirmed through genetic testing as early as a few days after birth.
PWS AWARENESS MONTH FACT #4

There are three genetic causes of PWS:

- Uniparental Disomy
- Deletion
- Imprinting Defect
PWS AWARENESS MONTH FACT #5

Deletion occurs when the 15q11-13 region is missing on the paternal chromosome 15

51% of individuals with PWS have deletion

There are several deletion subtypes
PWS AWARENESS MONTH FACT #6

Imprinting defect occurs when the 15q11-13 region is inactive on the paternal chromosome 15.

Less than 5% of people with PWS

The only type that can be hereditary
PWS AWARENESS MONTH FACT #7

Uniparental Disomy occurs when the child receives two chromosome 15s from mom and none from dad.

51% of individuals with PWS have deletion.

There are several deletion subtypes.

Prader-Willi Syndrome Association USA
Saving and Transforming Lives
Human growth hormone (GH) is the only FDA approved drug to treat PWS. GH decreases body fat, increases muscle mass, improves bone density and positively affects behavior and cognition. Many individuals with PWS start GH before their first birthday.
Infants with PWS may require the use of feeding tubes to obtain adequate nutrition.
Individuals with PWS have an incidence of developing scoliosis at rates between 40-90%. Thankfully, there are several treatment options available.

- Bracing
- Casting
- Surgery
Impaired vision is a treatable symptom of PWS either with corrective lenses or surgery.
Hypogonadism and cryptorchidism are common in infants with PWS. Treatment options include medication and surgical intervention.
Many individuals with PWS have sensory integration deficits in their vestibular, proprioceptive, tactile and oral-motor systems. A sensory integration program designed by an Occupational Therapist is the most common form of treatment.
PWS AWARENESS MONTH FACT #14

Many individuals with PWS have decreased pain signals, often masking injuries and illness.
Excessive daytime sleepiness (EDS), cataplexy, and narcolepsy affect many individuals with PWS. Join us September 27th for PWSA | USA’s Virtual Sleep Summit to learn more about disordered sleep in PWS.
Individuals with PWS experience high levels of anxiety that negatively affects functioning. With the help of therapies, social stories and medication, anxiety may be better managed.
Hypotonia affects individuals with PWS throughout their lives. The use of growth hormone, play, and therapies improves muscle tone.
PWS caregivers incur high caregiver burden that impacts most aspects of caregiver life.
Gross motor milestones are often delayed due to hypotonia. Early access to physical therapy and gross motor play aid in improving gross motor strength.
There is not one best “PWS” diet, following what is sustainable for your family is best. Making healthy life-style choices, limiting processed foods and eating a diet focused on natural whole foods and healthy fats is encouraged.
PWS AWARENESS MONTH FACT #21

Temperature regulation can be a concern for individuals with PWS. They may overheat on a warm day or be at risk for hypothermia on a cold day.
PWS is one of 7,000 rare diseases. This is why we need YOU to join our advocacy efforts.
Similar to other spectrum disorders, individuals with PWS may have difficulty reading facial expressions and social cues. The use of social stories can be helpful in identifying emotions.
At PWSA USA, we work to integrate what we have learned about the needs of our families with research that will make a practical difference in the lives of those affected by PWS.
Historically, measured IQ’s range from normal to moderate intellectual disability. Many individuals with PWS are now working on post-secondary education goals.
Hyperphagia symptoms commonly begin between ages 3 and 8. Currently, there are no FDA approved treatments for hyperphagia.
Individuals with PWS are at increased risk for choking, subclinical dysphagia (silent choking) and aspiration and should be supervised while eating or drinking.
PWS AWARENESS MONTH FACT #28

Many families utilize cabinet and refrigerator locks to keep their loved ones safe and decrease their anxiety.
Many individuals with PWS have poor impulse control placing them at risk of injury or harm. The use of social stories and therapy may improve impulse control.
Many individuals with PWS present with speech and language deficits. Speech therapy is often provided through early intervention services.
PWS AWARENESS MONTH FACT #31

Each year, PWSA | USA’s staff helps thousands of families.
